C++ OOP Header Files Rectangle Tutorial.....	1
Step 1: Single File Rectangle OOP .....	1
Step 2: Rectangle OOP with Multiple Files.....	3
Step 3: Build G++ Multiple File Projects .....	6
Assignment Submission.....	7

Time required: 60 minutes

## Step 1: Single File Rectangle OOP

We will start with a C++ OOP program in a single file.

Enter the following code. This code defines the Rectangle class.

```

1  /**
2   * Filename: rectangle_oop.cpp
3   * Written by:
4   * Written on:
5   * Revised:
6   * Calculate the perimeter and area of a rectangle with C++ OOP
7   */
8  #include <iostream>
9
10 //*****
11 // Define Rectangle Class
12 //*****
13 class Rectangle
14 {
15     // ----- DEFINE PUBLIC METHODS ----- //
16 public:
17     // 2 parameter constructor
18     Rectangle(double width, double length)
19     {
20         this->m_width = width;
21         this->m_length = length;
22     }
23
24     double get_perimeter()
25     {
26         return ((this->m_width * 2) + (this->m_length * 2));
27     }
28
29     double get_area()
30     {
31         this->m_area = this->m_width * this->m_length;
32         return m_area;
33     }
34
35     // ----- DEFINE PRIVATE DATA MEMBERS ----- //
36 private:
37     double m_width;
38     double m_length;
39     double m_area;
40 };

```

```

42  //*****
43  //  main program entry point
44  //*****
45  int main()
46  {
47      double width{2.5};
48      double length{7.0};
49      std::cout << "\n -- Rectangle Calculator Single File --\n" << std::endl;
50      // Create rectangle object with 2 arguments
51      Rectangle rectangle1(width, length);
52
53      // Return and display values from object methods
54      std::cout << " Perimeter: " << rectangle1.get_perimeter() << std::endl;
55      std::cout << " Area: " << rectangle1.get_area() << std::endl;
56      std::cout << std::endl;
57
58      // Pause until a key is pressed
59      system("PAUSE");
60      return 0;
61  }

```

Example run:

```

-- Rectangle Calculator Single File --

Perimeter: 19
Area: 17.5

Press any key to continue . . .

```

## Step 2: Rectangle OOP with Multiple Files

As projects become bigger, placing all the code in a single file becomes unmanageable.

**rectangle.h** defines the public method prototypes and private data members.

```

1  /**
2   * Filename: rectangle.h
3   * Written by:
4   * Written on:
5   * Revised:
6   * Header file which defines prototypes for Rectangle class
7   */
8
9  #ifndef RECTANGLE_H
10 #define RECTANGLE_H
11
12  //*****
13  // Define Rectangle Class
14  //*****
15  class Rectangle
16  {
17      // ----- DEFINE PUBLIC METHOD PROTOTYPES ----- //
18  public:
19      // 2 parameter constructor prototype
20      Rectangle(double width, double length);
21      double get_perimeter();
22      double get_area();
23
24      // ----- DEFINE PRIVATE DATA MEMBERS ----- //
25  private:
26      double m_width;
27      double m_length;
28      double m_area;
29  };
30 #endif

```

**rectangle.cpp** implements the public methods and data members defined in the **rectangle.h** file.

```

1  /**
2   * Filename: rectangle.cpp
3   * Written by:
4   * Written on:
5   * Revised:
6   * Implement Rectangle class constructor and methods
7   */
8
9  #include "rectangle.h"
10
11  // ----- IMPLEMENT PUBLIC METHODS -----//
12  // Implement 2 parameter constructor
13  Rectangle::Rectangle(double width, double length)
14  {
15      this->m_width = width;
16      this->m_length = length;
17  }
18
19  double Rectangle::get_perimeter()
20  {
21      return ((this->m_width * 2) + (this->m_length * 2));
22  }
23
24  double Rectangle::get_area()
25  {
26      this->m_area = this->m_width * this->m_length;
27      return m_area;
28  }

```

**rectangle\_main.cpp** is the main program which uses the previous 2 files.

```

1  /**
2   * Filename: rectangle_main.cpp
3   * Written by:
4   * Written on:
5   * Revised:
6   * Calculate the perimeter and area of a rectangle
7   * using header files with OOP
8   */
9  #include <iostream>
10 #include "rectangle.h"
11
12 int main()
13 {
14     double width{2.5};
15     double length{7.0};
16     std::cout << "\n -- Rectangle Calculator Multiple Files --\n" << std::endl;
17     // Create rectangle object with 2 arguments
18     Rectangle rectangle1(width, length);
19
20     // Return values from object methods
21     std::cout << " Perimeter: " << rectangle1.get_perimeter() << std::endl;
22     std::cout << " Area: " << rectangle1.get_area() << std::endl;
23     std::cout << std::endl;
24
25     // Pause until a key is pressed
26     system("PAUSE");
27     return 0;
28 }

```

### Step 3: Build G++ Multiple File Projects

```

g++ -Wall rectangle.h rectangle_main.cpp rectangle.cpp -o rectangle_main.exe
pause

```

Instead of typing this in every time, let's make a batch file for this.

1. In VSCode → create a file named: **compile.bat**
2. Copy the above code and paste it into the batch file.
3. The pause command on the second line pauses the command line window so you can see if it worked or not.
4. In File Explorer → Double Click **compile.bat**

Example run:

```
-- Rectangle Calculator Multiple Files --  
Perimeter: 19  
Area: 17.5  
Press any key to continue . . .
```

---

## Assignment Submission

1. Attach the program files.
2. Attach screenshots showing the successful operation of the program.
3. Submit in Blackboard.
